

Day 4 Task 4 - Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

Liquid cooling is a better choice here because streaming and gaming at the same or separately makes the GPU work hard for hours without break.

Air cooling relies on heatsink and fan to dissipate heat, but under prolonged usage it can struggle to keep up, so the GPU might overheat and slow down, causing a lag or choppy streaming.

On the other hand, liquid cooling uses a coolant loop radiator to keep the GPU cooler for longer, thus allowing the GPU to clock at higher speeds for a longer time period. so streaming and games run smoother.

The cost and maintenance of liquid cooling is more than air cooled but it would be worth the price.
