

Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

	Air cooling	Liquid cooling
Cost	cheaper - has a heatsink and fan	more expensive -includes components like pumps, radiators and piping
Cooling Efficiency	Less efficient than liquid cooling - with heavy processing can struggle	More efficient -keeps temperatures lower even during heavy processing
Noise level	Louder due to fan	Generally quieter
Maintenance	Low maintenance -occasional cleaning of dust from fan	Higher maintenance - checking for leaks, replacing coolant, pump maintenance
Space / Installation	Simple to install and less space required	Bulkier and complicated to install
