Topic 5: Weekly Review and Practical

Item	Details
Server	Server02 (Windows Server 2019, new Domain Controller), VirtualBox VM
Domain	musicstream.local (new forest, separate from the existing lab.com domain)
Clients	client01 and client02 (Windows 10), joined to musicstream.local
Users	arjit.singh, neha.kakkar (domain users, in the "music" OU)
GPO	"Prohibit access to Control Panel and PC settings", linked to the OU containing both users
Shared folder	playlists, shared from Server02 (arjit.singh Read & Write, neha.kakkar Read-only)

Task 1: Question: Install Windows Server (any version) on a virtual machine using VirtualBox or VMware, and take a screenshot of the successful installation desktop.

A new VM named Server02 was created in VirtualBox and Windows Server 2019 was installed on it.

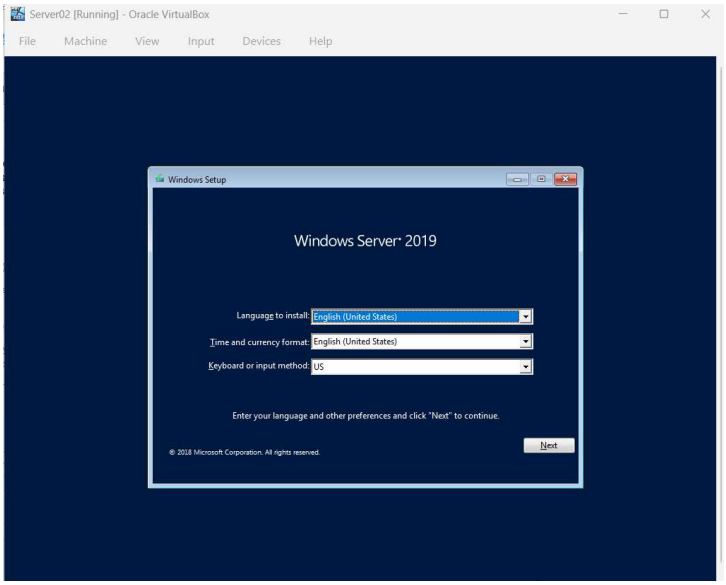

Figure 1: Windows Server 2019 Setup, language and locale selection

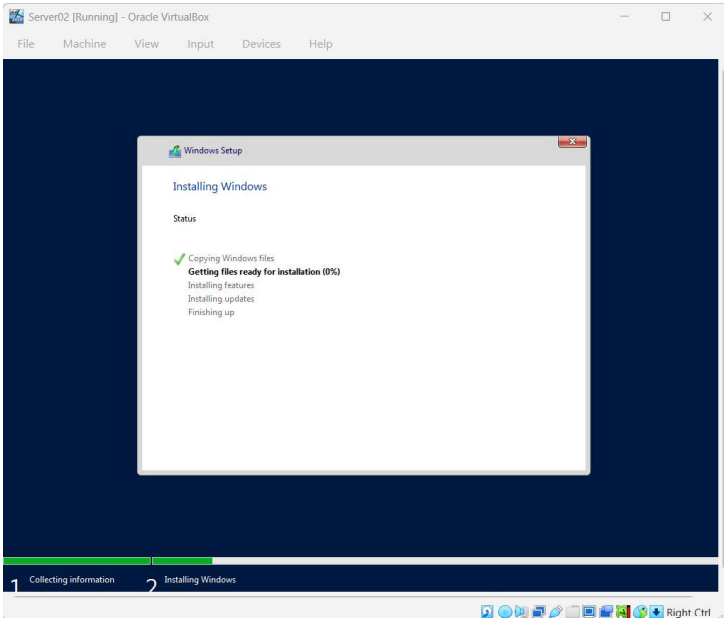

Figure 2: Windows Server 2019 installation in progress

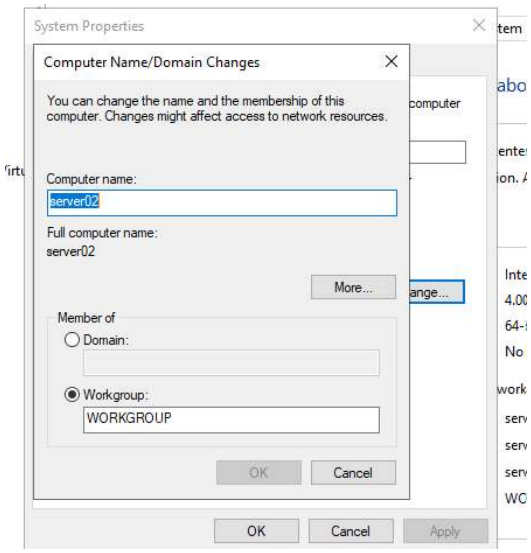

Figure 3: Server02 after installation, computer name set and Server Manager running

Task 2: Question: Create a new Active Directory domain called "musicstream.local" and add two user accounts: one for 'arijit.singh' and one for 'neha.kakkar'. Capture screenshots of the AD Users and Computers console showing both accounts.

Active Directory Domain Services and DNS Server roles were installed on Server02 and promoted to a new forest named musicstream.local, giving Server02 a static IP (20.20.20.1) and pointing its own DNS to itself. An organizational unit was created and the two user accounts were added inside it.

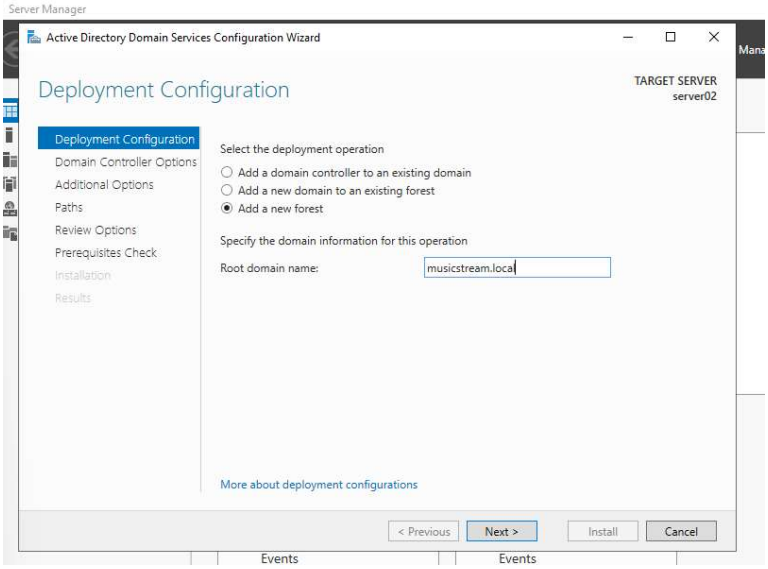

Figure 4: AD DS Configuration Wizard, deployment configuration set to "Add a new forest", root domain musicstream.local

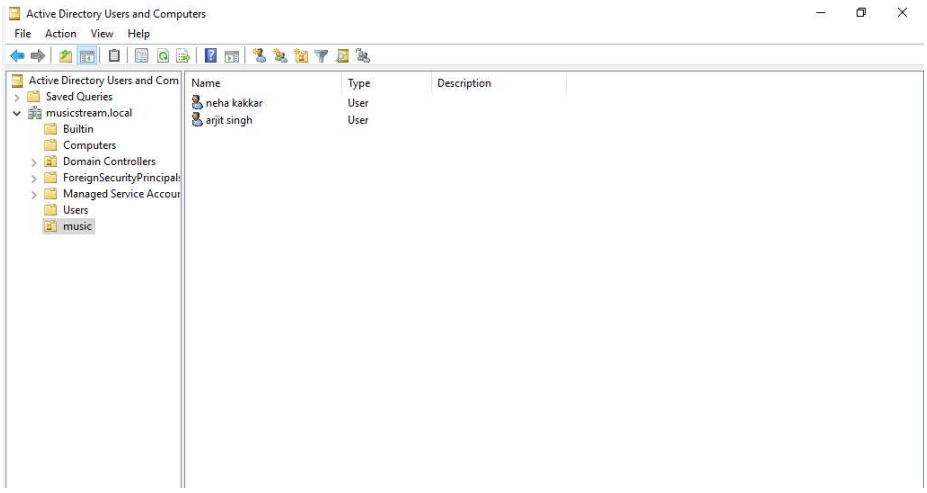

Figure 5: Active Directory Users and Computers, both accounts (neha kakkar, arjit singh) inside the OU

Task 3: Question: Set up a Group Policy Object (GPO) that prevents users from accessing Control Panel, and link it to the 'Users' OU you created. Show before-and-after screenshots of the policy in effect for one of your test users.

A GPO was created and edited under User Configuration > Policies > Administrative Templates > Control Panel, using the built-in setting "Prohibit access to Control Panel and PC settings", set from Not Configured to Enabled, and linked to the OU holding both users.

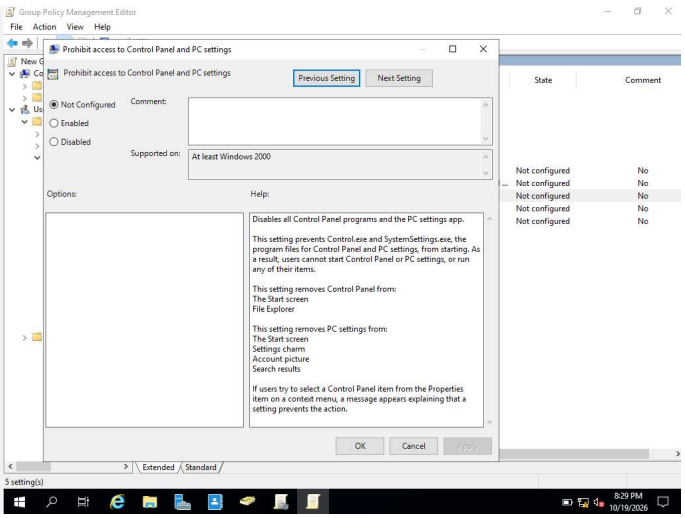

Figure 6: GPO setting "Prohibit access to Control Panel and PC settings" before the change (Not Configured)

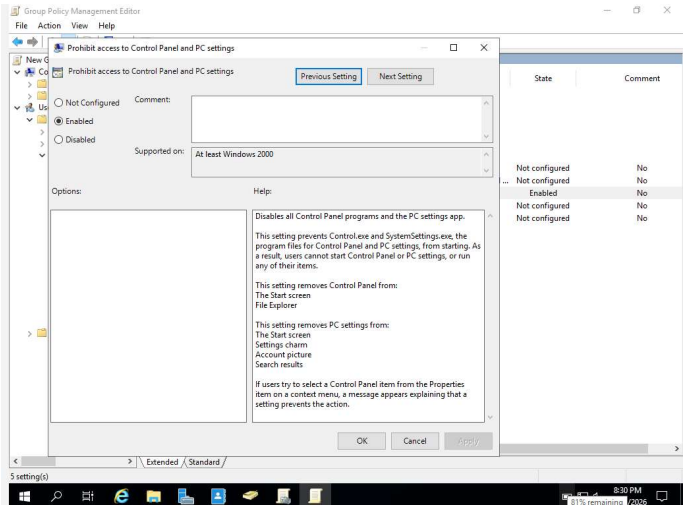

Figure 7: Same setting changed to Enabled

After enabling the setting and linking the GPO, gpupdate /force was run on both client machines, and the test users signed in again so the policy would apply to their sessions.

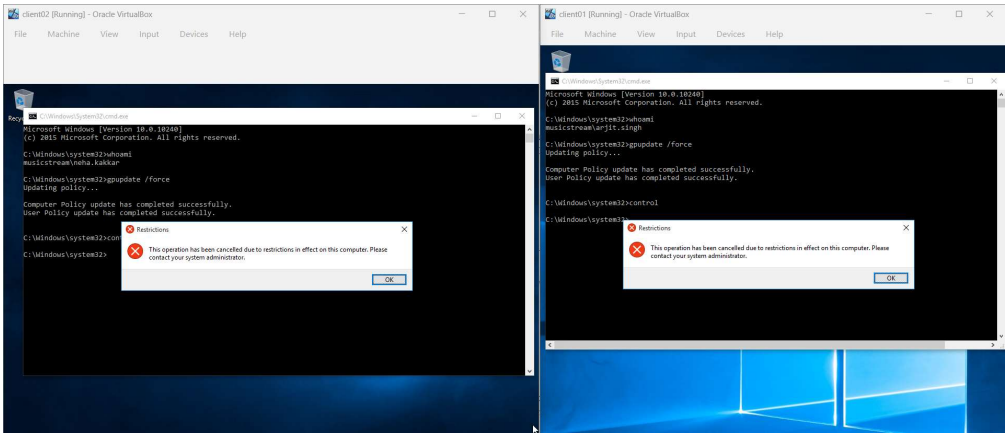

Figure 8: AFTER — logged in as musicstream\neha.kakkar (client02, whoami) and musicstream\arjit.singh (client01, whoami); running "control" on both now returns "This operation has been cancelled due to restrictions in effect on this computer"

Task 4: Question: Share a folder named 'Playlists' on your Windows Server so that only the 'arijit.singh' user can read and write files, but 'neha.kakkar' can only read. Demonstrate this by logging in as each user and attempting to create or edit a file in the shared folder.

A folder named 'playlists' was shared from Server02. NTFS permissions were set on the Security tab (arjit.singh: Modify, giving Read & Write; neha.kakkar: Read & execute, List folder contents, Read only), and the same levels were set in the Network Sharing wizard (arjit.singh: Read/Write, neha.kakkar: Read).

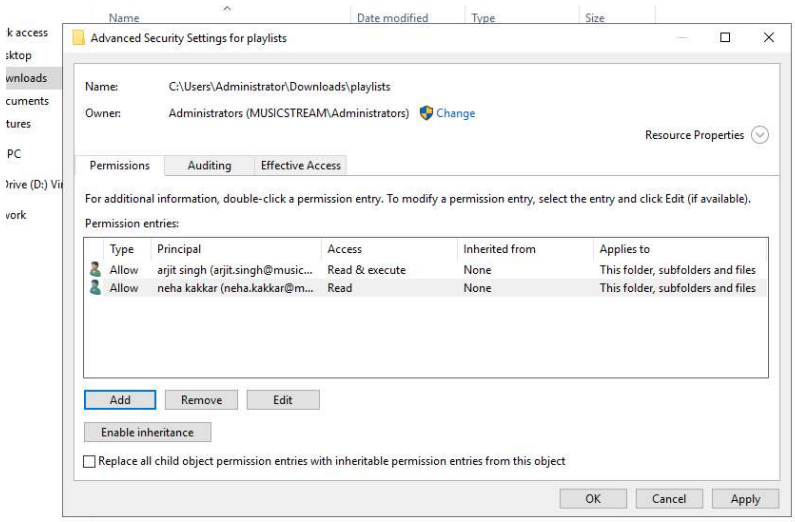

Figure 9: Advanced Security Settings for the playlists folder, showing the permission entries for each user

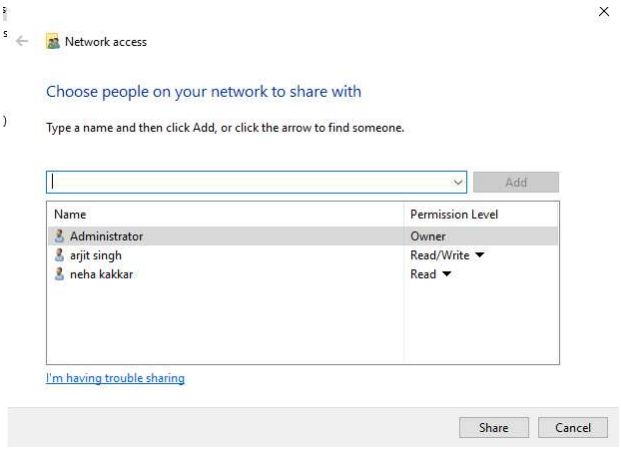

Figure 10: Network access sharing wizard, arjit singh set to Read/Write and neha kakkar set to Read

Testing: logged in as arjit.singh on client01 and copied a file into the share, which succeeded. Logged in as neha.kakkar on client02 and attempted the same copy into the share, which was refused.

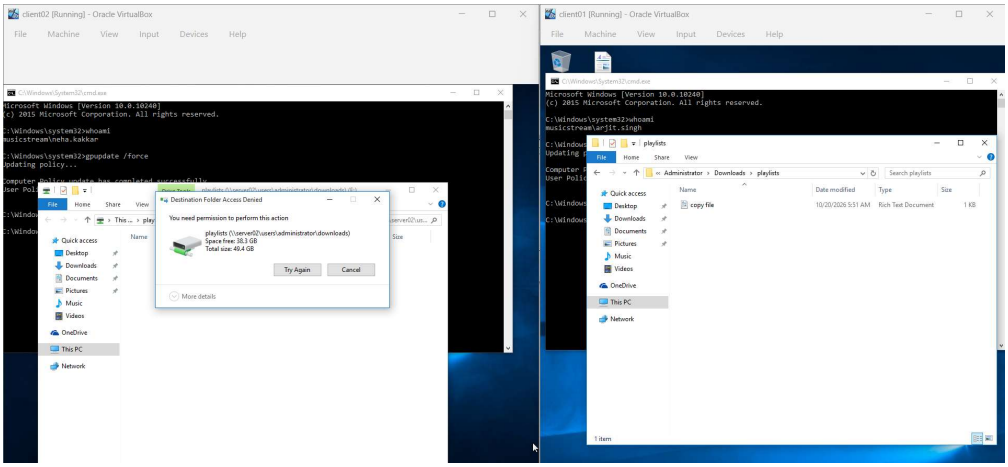

Figure 11: arjit.singh (right) successfully copies "copy file" into the playlists share; neha.kakkar (left) gets "Destination Folder Access Denied — You need permission to perform this action" on the same action

User	Action	Result	Reason
arjit.singh	Copy file into playlists	Allowed	NTFS: Modify, so writing is permitted
neha.kakkar	Copy file into playlists	Denied	NTFS: Read & execute / Read only, no Write permission

Task 5: Write a short report summarizing your domain, user, GPO, and shared folder setup, and describe one challenge you faced and how you solved it.

Challenge: client could not sign in to the new domain

While joining a client VM to musicstream.local, the sign-in screen returned "There are currently no logon servers available to service the logon request."

Cause: the client could not reach Server02 to authenticate. This happens when the client and the domain controller are not on the same virtual network, when the client's DNS server is not pointed at the domain controller, or when Server02 was not fully started yet.

Solution: the client's VirtualBox network adapter was set to the same Internal Network as Server02, and its TCP/IPv4 settings were changed to a static IP in the same subnet (20.20.20.x, mask 255.0.0.0) with its DNS server set to Server02's address (20.20.20.1), instead of an automatic or unrelated DNS address. A ping to 20.20.20.1 was used to confirm connectivity before retrying the domain sign-in, which then succeeded.

Summary of final configuration

Component	Final state
Domain	musicstream.local (new forest, independent of lab.com)
Domain controller	Server02, static IP 20.20.20.1, DNS pointing to itself
OU	"music" OU containing arjit.singh and neha.kakkar
GPO	"Prohibit access to Control Panel and PC settings" set to Enabled, linked to the OU

Component	Final state
GPO test result	Control Panel/Settings blocked for both arjit.singh and neha.kakkar after gpupdate
Shared folder	playlists — arjit.singh: Read & Write; neha.kakkar: Read-only
Folder test result	arjit.singh can copy files in; neha.kakkar is denied the same action
