

Task 4: Filter Active Premium Users

Interactive Checker with Random Data + Search Box

Given an array of user objects with properties: username, isPremium, and lastLogin, this task returns only those users who are premium and have logged in within the last 7 days (reference date: 2024-06-10). This PDF has a working HTML/JavaScript page embedded as an attached file (**active_premium_users_checker.html**), since PDF viewers cannot execute web pages directly.

How to test it:

1. Open this PDF in **Adobe Acrobat Reader** (attachments do not work in most browser PDF viewers).
2. Click the paperclip / Attachments icon in the left sidebar.
3. Right-click **active_premium_users_checker.html** and choose **Save Attachment**.
4. Open the saved file in any web browser (double-click it — do NOT run it with Python).
5. The table loads with 15 randomly generated users. Type a username into the search box to filter and check that user's Premium / Active status.

Filtering logic used:

```
function getActivePremiumUsers(userList) {  
  const sevenDaysAgo = new Date(today);  
  sevenDaysAgo.setDate(today.getDate() - 7);  
  return userList.filter(user =>  
    user.isPremium && new Date(user.lastLogin) >= sevenDaysAgo  
  );  
}
```

Expected behaviour:

- A user is marked **Active** if their last login falls between 2024-06-03 and 2024-06-10.
- Only users who are both **Premium = Yes** and **Active** count as the target result set described in the original task.
- The search box filters the visible table live as you type a username.

Note: User data (names, premium status, last login dates) is randomly generated each time the page loads, for demonstration purposes.
