

TASK 4: Upgrading PC for running FIFA Smoothly

1. CPU (Processor)

A higher rated processor will help prevent slowdown. If the CPU lags, there will be delays in player reactions or slower simulation.

CPU handles AI decisions, ball movement, and background tasks.

2. GPU

The GPU is the heart of gaming visuals. A weak GPU causes stuttering, low frame rates & blurry textures. Upgrading ensures smooth gameplay, and smooth animation.

3. RAM

Insufficient RAM forces the CPU to constantly request data from hard drive, thus giving slow performance. Reduces load time.

4. Storage.

Upgrading hard drive from HDD to SSD reduces loading times.

5. Cooling:-

High performance / upgraded components generate heat. Better cooling maintains efficient performance.

___/___/___

6. Power supply unit

- An upgrade CPU & GPU require more power, so need to upgrade PSU to ensure stability & prevent crashes.
